Docker and Kubernetes – Course Outline

Duration -32 Hours

Objectives

At end of this workshop, participants will able to :

- Get understanding of Docker fundamentals, architecture, features and usage
- Get understanding of Kubernetes fundamentals, architecture, features and usage
- Containerize web applications / services using Docker and deploy into Kubernetes platform

Note: *This course is designed for beginner to intermediate level.*

Audience

Developers who are interested to learn how to containerize applications / services using Docker and manage the containers to handle scalability, fault tolerance, high availability using Kubernetes platform.

Pre-requisite

- Knowledge on Virtualization
- Knowledge on Distributed Computing
- Familiarity on Application Packaging and Deployment

Hardware & Network Requirements

- Desktop/Laptop with minimum 8GB RAM
- Open Internet connection (minimum 1 Mbps per user)

Software Requirements

- Windows / Linux / Mac OS
- Oracle VirtualBox
- Pre-configured image with all required softwares to be shared along with setup instructions before the training for labs.

Course Outline

Module-1: Introduction to Docker (16 hours)

- Why is Docker?
- What is Docker?
- What is Container?
- Virtual Machines vs Containers
- Benefits and Limitations of Docker
- Docker Architecture
    - Docker Client
    - Docker Server (Daemon)
- Docker Ecosystem

- Docker Engine
- Docker Registry
- Docker Compose
- Docker File
- Image
- Container

- Features Overview
  - Storage
  - Container Linking
  - Networking
- Docker Swarm Overview
- **Demo/Lab:** Verifying Docker Installation
- **Demo/Lab:** Pull and Run standard docker images
- **Demo/Lab:** Manage docker image and container life cycle
- **Demo/Lab:** Create Docker File for sample web application
- **Demo/Lab:** Build Docker Image for sample web application
- **Demo/Lab:** Run sample web application Docker Image locally
- **Demo/Lab:** Tag Docker Image build for sample web application
- **Demo/Lab:** Create DockerHub Account
- **Demo/Lab:** Upload (Push) Docker Image to DockerHub registry
- **Demo/Lab:** Download (Pull) Docker Image from DockerHub registry and run
- **Demo/Lab:** Store container data in the host file system using bind mount storage
- **Demo/Lab:** Store container data in the host file system using volume storage
- **Demo/Lab:** Store container data in the host system memory using tmpfs mount storage
- **Demo/Lab:** Link two containers and share data between them
- **Demo/Lab:** Create container networking with custom bridge network and share data between them
- **Demo/Lab:** Create and manage multi container applications using docker compose
- **Demo/Lab:** Create sample docker swarm cluster and manage docker containers

Module-2: Introduction to Kubernetes (16 hours)

- Kubernetes Overview
- Kubernetes Architecture
- Kubernetes Setup and Configuration
- Components
  - Master Components
  - Node Components
  - Client Components
- Kubernetes Objects
- Kubernetes Containers
- Kubernetes Workloads
  - Pods
  - Deployments
  - Jobs
  - Replication
- Services and Load Balancing
- Storage Volumes
- Networking

- Security
- Creating and deploying an application in Kubernetes with Docker
- Configure Auto Scaling and High Availability
- Managing and accessing Kubernetes cluster with API and Kubectl
- Kubernetes Monitoring with Dashboard
- **Demo/Lab:** Verifying Kubernetes Installation
- **Demo/Lab:** Enable and access Kubernetes dashboard
- **Demo/Lab:** Create pod and deploy into K8s
- **Demo/Lab:** Create multi container pod and deploy into K8s
- **Demo/Lab:** Create deployment for sample web application with replication
- **Demo/Lab:** Create service to access the application internally
- **Demo/Lab:** Create service to access the application externally
- **Demo/Lab:** Create service to access the application with load balancing
- **Demo/Lab:** Create service to access the application externally
- **Demo/Lab:** Store container data in the host file system with local path
- **Demo/Lab:** Store container data in the host file system with Persistent Volume Claim
- **Demo/Lab:** Verify load balancing and auto healing
- **Demo/Lab:** Create custom pod networking and share data between them
- **Demo/Lab:** Create and deploy sample application into K8s with auto scalling
- **Demo/Lab:** Create ConfigMap to store configuration data
- **Demo/Lab:** Create Secrets to store confidential data

Why Choose Xebia Academy?

- **World-class Training**
  - Xebia Academy offers an intensive learning program and industry-specific training courses. We provide you the right tools and a conducive environment to help you progress exponentially in your learning path.

- **Expert Advantage**
  - Boost your business by learning from the experts. Learn from the industry experts like Jeff Sutherland, Daniel Steinberg, Arlen Bankston, Pierluigi Pugliese, Dave Farley, Bas Vodde and Gunther Verheyen.

- **Flexible Learning**
  - Pick the right course to develop your skills. Either choose a public class at our training centre across the globe, or learn with your colleagues in a customized, in-company training program, facilitated on-site at your location, anywhere in the world.
